

ABSTRACT OF THE DISCLOSURE

1
2 A locking or fastener system for joining or attaching a first workpiece spaced
3 apart from a second workpiece. A threaded opening is provided in the first workpiece for
4 receiving a screw/collar combination. The screw has a threaded end and a head end. The
5 screw head is rotatably attached within a cavity within the collar. External threads on
6 the wall of the collar cooperate with the threads in the opening in the first workpiece.
7 When the collar is secured to the first workpiece, the screw may be rotated to engage the
8 second workpiece. By using a wrench having an outer body with extending blades and
9 an inner rod having a screw face, the collar and screw may be tightened to join two
10 spaced-apart workpieces.
